KUSHAGRA GOYAL

Registration no.: 25BCE11143

Computer Science and Engineering

ACADEMIC YEAR: 2025-26

Introduction

This project is a comprehensive digital portfolio developed as part of the CSE0001 - Digital Literacy course. The work is framed within the professional scenario of being a Student Digital Ambassador, a role dedicated to helping peers navigate the digital world safely and professionally.

The primary objective of this assignment was to build a foundational digital presence across five critical areas: visual communication, professional networking, technical collaboration, formal correspondence, and cyber awareness. By completing these five tasks—ranging from creating a literacy infographic to researching real-world cybercrime cases—I have established a professional identity on

platforms such as GitHub, LinkedIn, and Kaggle.

This report documents my technical journey, observations, and reflections on using browser-based tools to enhance my academic and professional productivity. Ultimately, this repository serves as a permanent digital asset for my engineering career at VIT Bhopal University.

Task-1 report: Digital Literacy Awareness infographic

As a Student Digital Ambassador, I created a visual resource titled "The Digital Ambassador's Guide" using **Canva**. The infographic covers five core areas: the definition of digital literacy, essential tools for engineering students (like GitHub and Google Workspace), online safety measures, building a professional presence, and the rules of email etiquette. My goal was to provide a "one-stop" visual reference that my peers could use to quickly understand their digital responsibilities and opportunities.

I chose Canva because its modular "List Infographic" templates allowed me to separate distinct modules of the course into easy-to-read sections. One thing I found particularly interesting was the challenge of "Information

Design"—deciding how to explain a complex topic like "Professional Online Presence" in just two sentences. It was difficult to keep the design minimal while ensuring it remained informative. However, this process taught me that in digital communication, clarity is more important than length. This infographic serves as the first entry in my digital portfolio, establishing my role in helping others navigate the digital world safely.

Task-2 report: Build Your Student Digital Portfolio

For this task, I established my professional digital presence by setting up accounts on GitHub, LinkedIn, and Kaggle. I chose GitHub because it is the industry standard for version control and showcasing code, while LinkedIn allows me to connect with industry professionals and alumni. For my third platform, I selected Kaggle to engage with the global [e.g., developer/data science] community.

On GitHub, I created a personalized Profile README to introduce myself and my academic goals to anyone visiting my repository. On LinkedIn, I updated my education details to reflect my current

status at VIT Bhopal University. Over the next four years, I plan to use these platforms as a living record of my growth. I intend to host all my major academic projects on GitHub and use LinkedIn to stay updated on internship opportunities and technical trends. Building these profiles now ensures that I have a professional "digital footprint" ready by the time I start applying for placements. This task taught me that a professional identity is something that must be curated intentionally over time.

Task-3(A) report: Coding Practice

For the coding portion of this module, I registered on HackerRank and tackled the 'Solve Me First' challenge. This exercise was my first introduction to how automated coding platforms evaluate logic and syntax in real-time. Completing this challenge helped me understand the importance of attention to detail in programming. Over the next four years, I plan to use this platform to consistently practice data structures and algorithms, which will be essential for my technical interviews and academic labs. It's a great way to bridge the gap between classroom theory and practical problem-solving.

Task-3(B) report: Google Workspace Collaboration

For the technical portion of this task, I utilized HackerRank to solve a beginner-level algorithmic challenge. This experience allowed me to familiarize myself with automated coding environments and test-driven development, which are critical for my future technical placements. By successfully passing the test cases, I demonstrated my ability to apply logical thinking to solve computational problems effectively.

For the collaboration portion, I designed a "Digital Literacy Awareness Quiz" using Google Forms. I curated five targeted questions to educate peers on cybersecurity, professional branding, and online safety. I also integrated a Google

Sheet to automate the collection and analysis of responses. This exercise highlighted the importance of cloud-based collaboration tools in academic and professional settings. Mastering these platforms ensures that I can efficiently manage data and communicate complex information to a wider audience. Combining technical problem-solving with digital collaboration has provided me with a well-rounded understanding of the tools required for a modern engineering student.

Task-4 report: Professional communication

A significant problem can arise in remote software development when a team lacks a clear "Definition of Done." In a hypothetical scenario, a developer might push a major update to a shared repository without documenting the changes in the commit message or the team's Slack channel. This lack of clarity can lead to "merge conflicts" that break the entire application, resulting in hours of lost productivity. To prevent this, the team should have implemented a strict communication protocol: every code change must be accompanied by a brief summary in a centralized project management tool like Jira and a peer-reviewed pull request. Consistent, transparent documentation is the only way to maintain technical stability in a digital environment

Task-5 report: Cybercrime Awareness & prevention

While researching the case study for Task 5, I was most surprised by the 'viral' nature of digital harassment and how quickly a single private image or comment can escalate into a global issue. The real-world case of Amanda Todd highlighted that cyberbullying is not just an online problem; it has devastating, permanent consequences in the physical world, affecting a person's safety, mental health, and social standing.

As a result of this research, I have decided to personally change my habit of using the same password across multiple platforms and will immediately enable Two-Factor Authentication (2FA) on all my academic and financial accounts. I also realized the critical importance of the National Cyber

Crime Helpline (1930) for students in India. This task has prepared me to be a more vigilant Student Digital Ambassador by helping my peers recognize and report online threats effectively.

Conclusion

Participating in this project as a Student Digital Ambassador has significantly enhanced my understanding of the digital landscape. Through the five modules, I have transitioned from a basic user to a professional digital citizen capable of managing complex platforms like GitHub, Kaggle, and HackerRank. I now possess the skills to communicate formally with both faculty and industry professionals while maintaining a secure and ethical online presence. Ultimately, this portfolio serves as a permanent foundation for my four-year journey at VIT Bhopal, ensuring I can navigate future academic and career opportunities with confidence and digital integrity.
